

## Vibe

### “We Vibed Together”

Vibe is the on-chain memory storage for activities we participated together as community displayed in a fun way as an enhanced group photo — In short, a fun proof of participation for community.

## Team

Rinna Clanuwat — Product Designer, Visual Artist, Community Builder

Paul Davis — Product Manager, Software Engineer, Game Developer

Community is when people come together to collaborate, participate, and do many great things. The sense of community is strengthened when people actually share memories together. In real life, when we go to events, we may take photos together. But group photo cannot identify who the person next to you in the photo actually is. In big group photos, we might not be able to even identify them by face. For online events, it's even more difficult.

With Vibe, we keep data of people who participate in the same events or activities on chain. Participants can come to Vibe to look back and play around with other people who participated in the same activities.

## How it works

### Event / Activity Admin

Create Vibe account (first time only)

Create New Vibe

Fill in details (Event name, date, time)

Choose the background of the event

Add the participant list

### Event / Activity Participant

Create Vibe account (first time only)

Choose avatar

Once added to participant list (by admin of those certain event/activity), the event participated will come up in dash board

By clicking the Vibe memory, the event/activity stage shows up — showing the avatar dancing along side with other participants in the same event.

## Future Development

Participants will be able to choose friends they would like to present in front rows with them from participant list
